

1 - Criar Rotas (create e store)

```
use Illuminate\Support\Facades\Route;

Route::get('/', function () {
    return view('welcome');
});

Route::prefix('clientes')->group(function () {
    Route::get('/create', [ClienteController::class, 'create']);
    Route::post('/store', [ClienteController::class, 'store']);
});

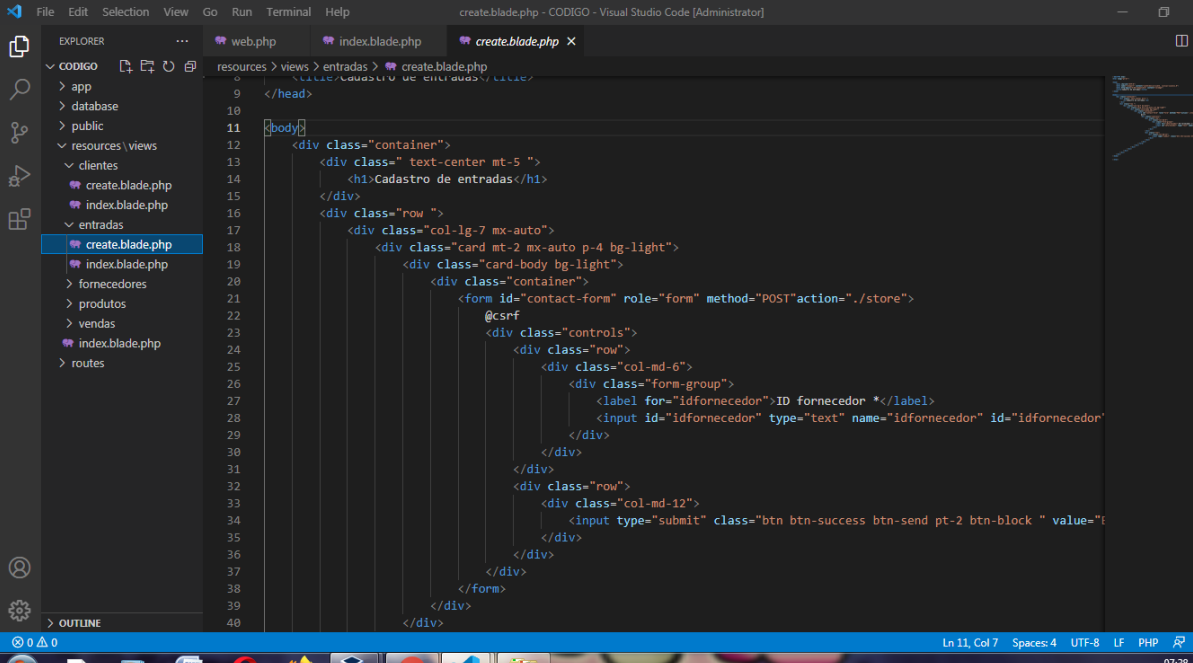

Route::prefix('produtos')->group(function () {
    Route::get('/create', [ProdutoController::class, 'create']);
    Route::post('/store', [ProdutoController::class, 'store']);
});

Route::prefix('entradas')->group(function () {
    Route::get('/create', [EntradaController::class, 'create']);
    Route::post('/store', [EntradaController::class, 'store']);
});

Route::prefix('vendas')->group(function () {
    Route::get('/create', [VendaController::class, 'create']);
    Route::post('/store', [VendaController::class, 'store']);
});

Route::prefix('fornecedores')->group(function () {
    Route::get('/create', [FornecedorController::class, 'create']);
    Route::post('/store', [FornecedorController::class, 'store']);
});
```

2 - Criar Views, models e migrations e fazer relacionamento entre as tabelas

```
<div class="container">
    <div class="text-center mt-5">
        <h1>Cadastro de entradas</h1>
    </div>
    <div class="row">
        <div class="col-lg-7 mx-auto">
            <div class="card mt-2 mx-auto p-4 bg-light">
                <div class="card-body bg-light">
                    <div class="container">
                        <form id="contact-form" role="form" method="POST" action="/store">
                            @csrf
                            <div class="controls">
                                <div class="row">
                                    <div class="col-md-6">
                                        <div class="form-group">
                                            <label for="idfornecedor">ID fornecedor *</label>
                                            <input id="idfornecedor" type="text" name="idfornecedor" id="idfornecedor">
                                        </div>
                                    </div>
                                    <div class="row">
                                        <div class="col-md-12">
                                            <input type="submit" class="btn btn-success btn-send pt-2 btn-block" value="Enviar">
                                        </div>
                                    </div>
                                </div>
                            </form>
                        </div>
                    </div>
                </div>
            </div>
        </div>
    </div>
</div>
```
